

March 2014

High Nature Value farming throughout EU-27 and its financial support under the CAP

Annex 1 (maps)

Disclaimer: The arguments expressed in this report are solely those of the authors, and do not reflect the opinion of any other party.

The report should be cited as follows:

Keenleyside, C, Beaufoy, G, Tucker, G and Jones, G (2014) *High Nature Value farming throughout EU-27 and its financial support under the CAP*. Report prepared for DG Environment, contract ENV B.1/ETU/2012/0035. Institute for European Environmental Policy: London.

Corresponding author: Clunie Keenleyside (ckeenleyside@ieep.eu).

Acknowledgements

The authors of this report would like to express thanks to many people for their expert contributions to this study.

They would like to thank in particular the case study partners, for the collecting and analysis of a very large proportion of the material upon which this report rests:

Antonella Trisorio from Istituto Nazionale di Economia Agraria (INEA), Italy;
Berien Elbersen, Alterra, the Netherlands;
Davy McCracken, EFNCP, the UK;
Irina Herzon from the University of Helsinki, Finland;
Jaroslav Pražan, Czech Republic;
Katalin Balazs from Reformkert Kertészeti Szolgáltató és Tanácsadó Betéti Társasá, Hungary;
Marek Jobda from Przyrodnicza, Poland;
Maria Teresa Pinto-Correia, University of Évora, Portugal;
Martin Hellicar from BirdLife Cyprus, Cyprus;
Miroslava Cierna-Plassmann, DAPHNE – Institute of Applied Ecology, Slovakia
Mojca Hraber, OIKOS, Slovenia;
Nat Page, EFNCP, Romania;
Patrick McGurn, EFNCP, Ireland;
Peri Kourakli, Hellenic Ornithological Society, Greece;
Petras Kurlavičius, Lithuania;
Pille Koorberg from the Agricultural Research Centre Estonia, Estonia;
Rainer Oppermann from the Institute for Agroecology and Biodiversity (IFAB) in Mannheim, Germany;
Viesturs Lārmanis, Latvia;
Vyara Stefanova, EFNCP, Bulgaria;
Wolfgang Suske from Suske Consulting, Austria.
Xavier Poux, EFNCP, France;
Yanka Kazakova, EFNCP, Bulgaria;

Evelyn Underwood, Ben Allen, Henrietta Menadue, and Jana Polakova for their analytical work and additional research support.

Kaley Hart and David Baldock for invaluable support and important contributions to individual chapters.

Figure 17: Regional distribution of semi-natural habitats in Estonia in 2010

Figure 18: Example of merging values of each grid-cell

NB Oppermann *et al* (2012) include an additional map showing agricultural land use intensity (p197)

Figure 17: Regional distribution of semi-natural habitats in Estonia in 2010

New approach for HNV farmland (covering all 3 HNV farmland types):

1x1km grid-cell based HNV farmland approach has been selected to further define all three types of HNV farmland. Chosen 15 indicators reflect low farming intensity, nature values and landscape mosaics are as following:

Land use and production intensity characteristics:

- share of permanent grassland from the total agricultural land;
- share of short-term rotational grasslands from the arable land;
- share of agricultural land under organic farming support;
- animal density and
- share of peat soils.

Nature conservation characteristics (nature values):

- share of semi-natural habitats (SNH);
- share of managed SNH;
- species diversity of selected farmland birds (data from Bird Atlas);
- share of protected areas and Natura 2000 areas and
- presence of protected species.

Landscape mosaics/diversity characteristics:

- Simpson diversity index;
- number of field parcels (physical blocks, LPIS);
- summed edge length of physical plots (fields in LPIS);
- total length of selected valuable linear objects and
- total number of selected valuable point objects.

One main criterion for such indicator selection was the availability of national data. Different national GIS datasets are used (eg Natura 2000 network, Estonian National Topographic Database, LPIS etc) Through data analysis all those 15 characteristics describing farmland values (eg landscape diversity, animal density, share of semi-natural grasslands etc), were linked with each grid.

For the final value-matrix of the grid-cells all individual indicator values of each cell (concrete numeric values converted into scale 1-5) were summed up. For example scales used for indicator 'share of agricultural land under organic farming support' are as follows:

- 0,1-10% 1 point
- >10-50% 3 points
- >50% 5 points

Figure 18: Example of merging values of each grid-cell

As a final result, each cell has a merged value that corresponds to the selected HNV features and characteristics at the site.

To validate the methodology the number of 1×1 km cells was expanded outside of the test area. In addition to selected pilot area, 2,420 cells were chosen by random sampling from the mainland and all 2,466 cells of coastal area. Total number of the tested grid-cells forms 18% of the total Estonian territory, which can be considered as representative sample.

This is considered a more accurate approach which helps to bring out the variations of HNV farmland and identify more valuable areas. The selected indicators are easily updated and available horizontally, aggregated data sets can be used by different stakeholders.

Figure 45: Distribution maps of HNV farmland by type and class of nature value

Distribution maps of HNV farmland for classes of value according to the criterion 1 (a), 2 (b) and 3 (c) and summary map (d) of the HNV farmland derived from the intersection of the three criteria. The reference unit for the classification are the AGRIT cells (10 x 10km²).

B = low; M = medium; H = high; HH = very high.

Portugal

The case study is still waiting for the maps.

NB There are no maps provided in Oppermann *et al* (2012).

Figure 51: Map showing areas of HNV, LFA and IBA in Romania

Figure 52: A simplified indication of the distribution of farming systems in Romania

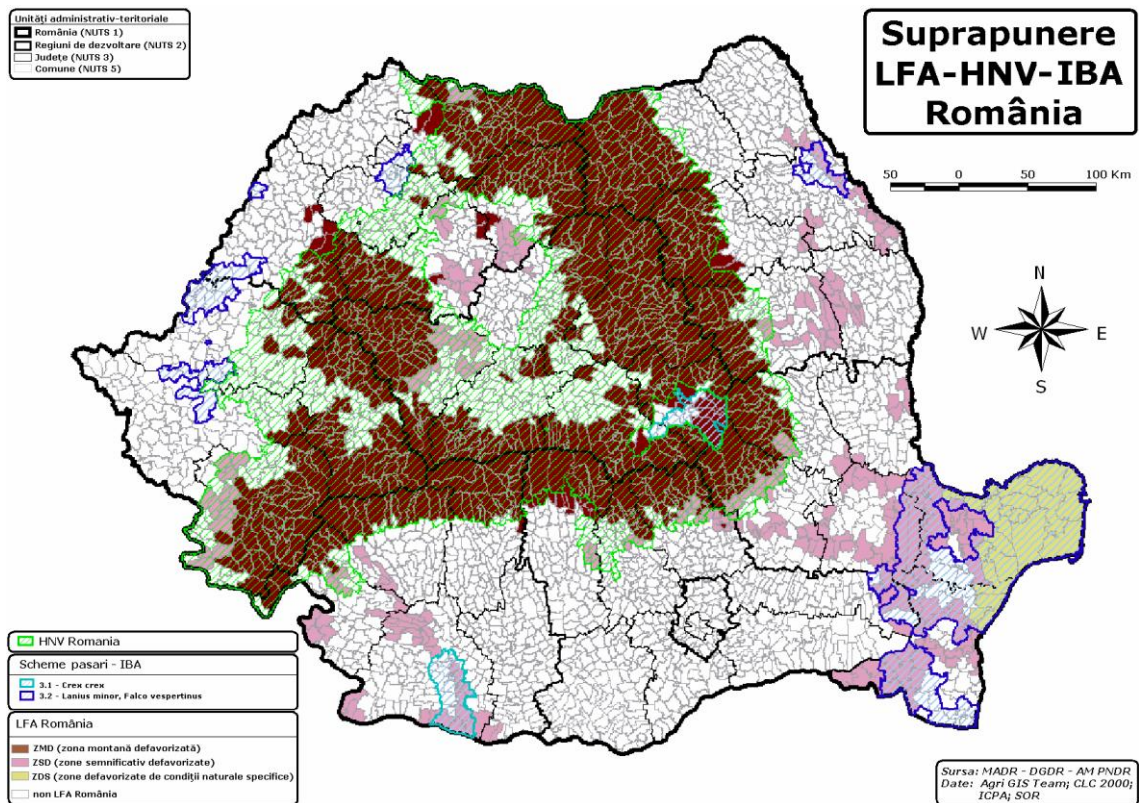

Figure 53: Map of the agri-environment packages in Romania, Packages 1, 2 and 3 and 6 (HNV Types 1 and 2)

Figure 54: Map of the agri-environment packages in Romania, Package 7 (HNV Type 3)

Additional maps are available at: http://www.fundatia-adept.org/bin/file/conference2010/HNV_conference_brochure1.pdf

NB Oppermann *et al* (2012) include the same map as the one depicted in Figure 47.

Figure 51: Map showing areas of HNV, LFA and IBA in Romania

NB In Romania the term HNV is used purely in the sense of permanent grassland. Note also that although IBA is commonly classified as type 3 HNV, it is regarded as a separate category to HNV.

Figure 60: The distribution of HNV farmland according to EEA's definition and analysis¹⁶

Figure 61: The distribution of meadows and pasture in Sweden¹⁷

Figure 62: The distribution of meadows and pastures in relation to the area of potential farmland¹⁸

Figure 63: Environmental quality of agricultural landscape in Sweden

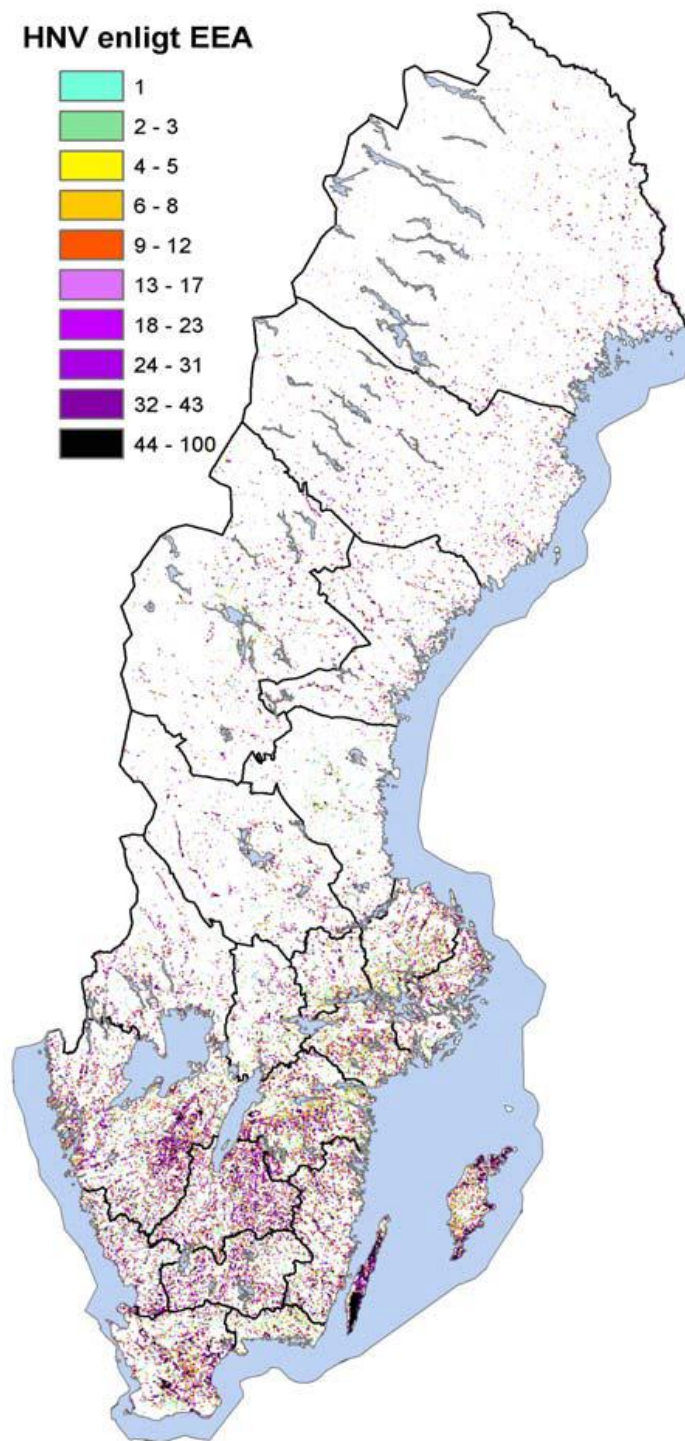

NB Oppermann *et al* (2012) provide no maps.

¹⁶ Figur 1: a) Fördelning av HNV-jordbruksmark enligt EEA:s definitioner och analyser (CLC-klasser, Ängs- och Betesmarksobjekt, Natura 2000, PBA och IBA). HNV-areal är redovisade som andel HNV-jordbruksmark per kvadratkilomterruta (dvs. totalareal inte jordbruksareal) (Paracchini in prep.) b) Klimatzoner i Sverige använda för stratifiering av de CLC klasser som representerar HNV-jordbruksmark enligt EEA (Metzger m.fl. 2005).

¹⁷ Figur 11 a Mönster i fördelningen av objekt i Ängs- och betesmarksinventeringen per ekoruta. Vissa områden har stora arealer ängs- och betesmarksobjekt. Det kan vara antingen som stora fäbodsobjekt i Norrland (översta rutan), mosaikartadelandskap i Götalands mellanbygder (mellersta rutan) eller som stora sammanhängande betesmarker på Öland (nedersta rutan). Det vita rutnätet är ekorutor med 5 km sida, gröna, orange och röda markeringar är olika typer av ängs- och betesmarksobjekt från Ängs- och betesmarksinventeringen.

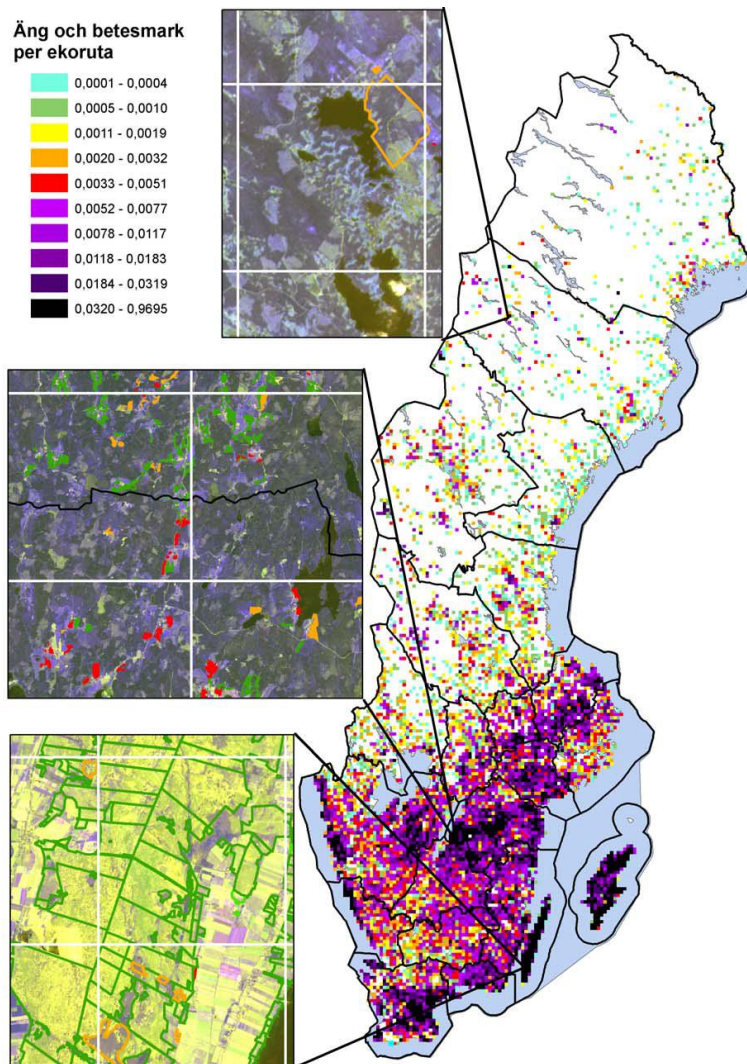

¹⁸ Figur 11 b Mönster i fördelningen av ängs- och betesmarker i förhållande till arealen potentiell jordbruksmark. I Norrlands inland utgör ängs- och betesmarksobjekten ofta en stor andel av den potentiella jordbruksmarken (översta rutan), det samma gäller för en del skogsbygder (mellersta rutan) och i kustbandet (nedersta rutan). Det vita rutnätet är ekorutor med 5 km sida, gröna, orange och röda markeringar är olika typer av ängs- och betesmarksobjekt från Ängs- och betesmarksinventeringen.

Figure 62: The distribution of meadows and pastures in relation to the area of potential farmland

Source: Edman and Wennberg (2008) p34

Figure 63: Environmental quality of agricultural landscape in Sweden

[Figur 13 Det är stora skillnader mellan länen på hur man bedömer bevarandevärde och miljökvalitetsmål för reservat. Det finns stora arealer jordbruksmark inom reservat som inte har med denna i sitt utpekade bevarandevärde. Det finns även län som inte bedömer odlingslandskapet som vare sig utpekat miljökvalitetsmål eller bevarandevärde i sina reservat (grått), de kan ha satt arter och habitat som bevarandevärdet istället för det specifika sammanhanget. Cirklarnas storlek är relativ arealen (tabell 6 och 7).]

Figure 13 There are major differences between the counties on how to assess the conservation value and environmental quality objectives for Reserve. There are large areas of agricultural land in the reserves who do not have this in their designated conservation value. There is also a county that does not consider the agricultural landscape as either designated environmental quality or conservation value of their reserves (gray), they may have set species and habitat conservation value instead of the specific context. Size of the circles is the relative area (Tables 6 and 7).
