# Ecosystem services and natural capital – the foundation of a green economy

Marianne Kettunen

Principal Policy Analyst, Institute for European Environmental Policy (IEEP) - London / Brussels

Guest Researcher Finnish Environment Institute - Helsinki

25 - 27 February 2015

International Symposium on Northern Development

Québec City, Canada

[www.ieep.eu](http://www.ieep.eu)

 @IEEP\_eu

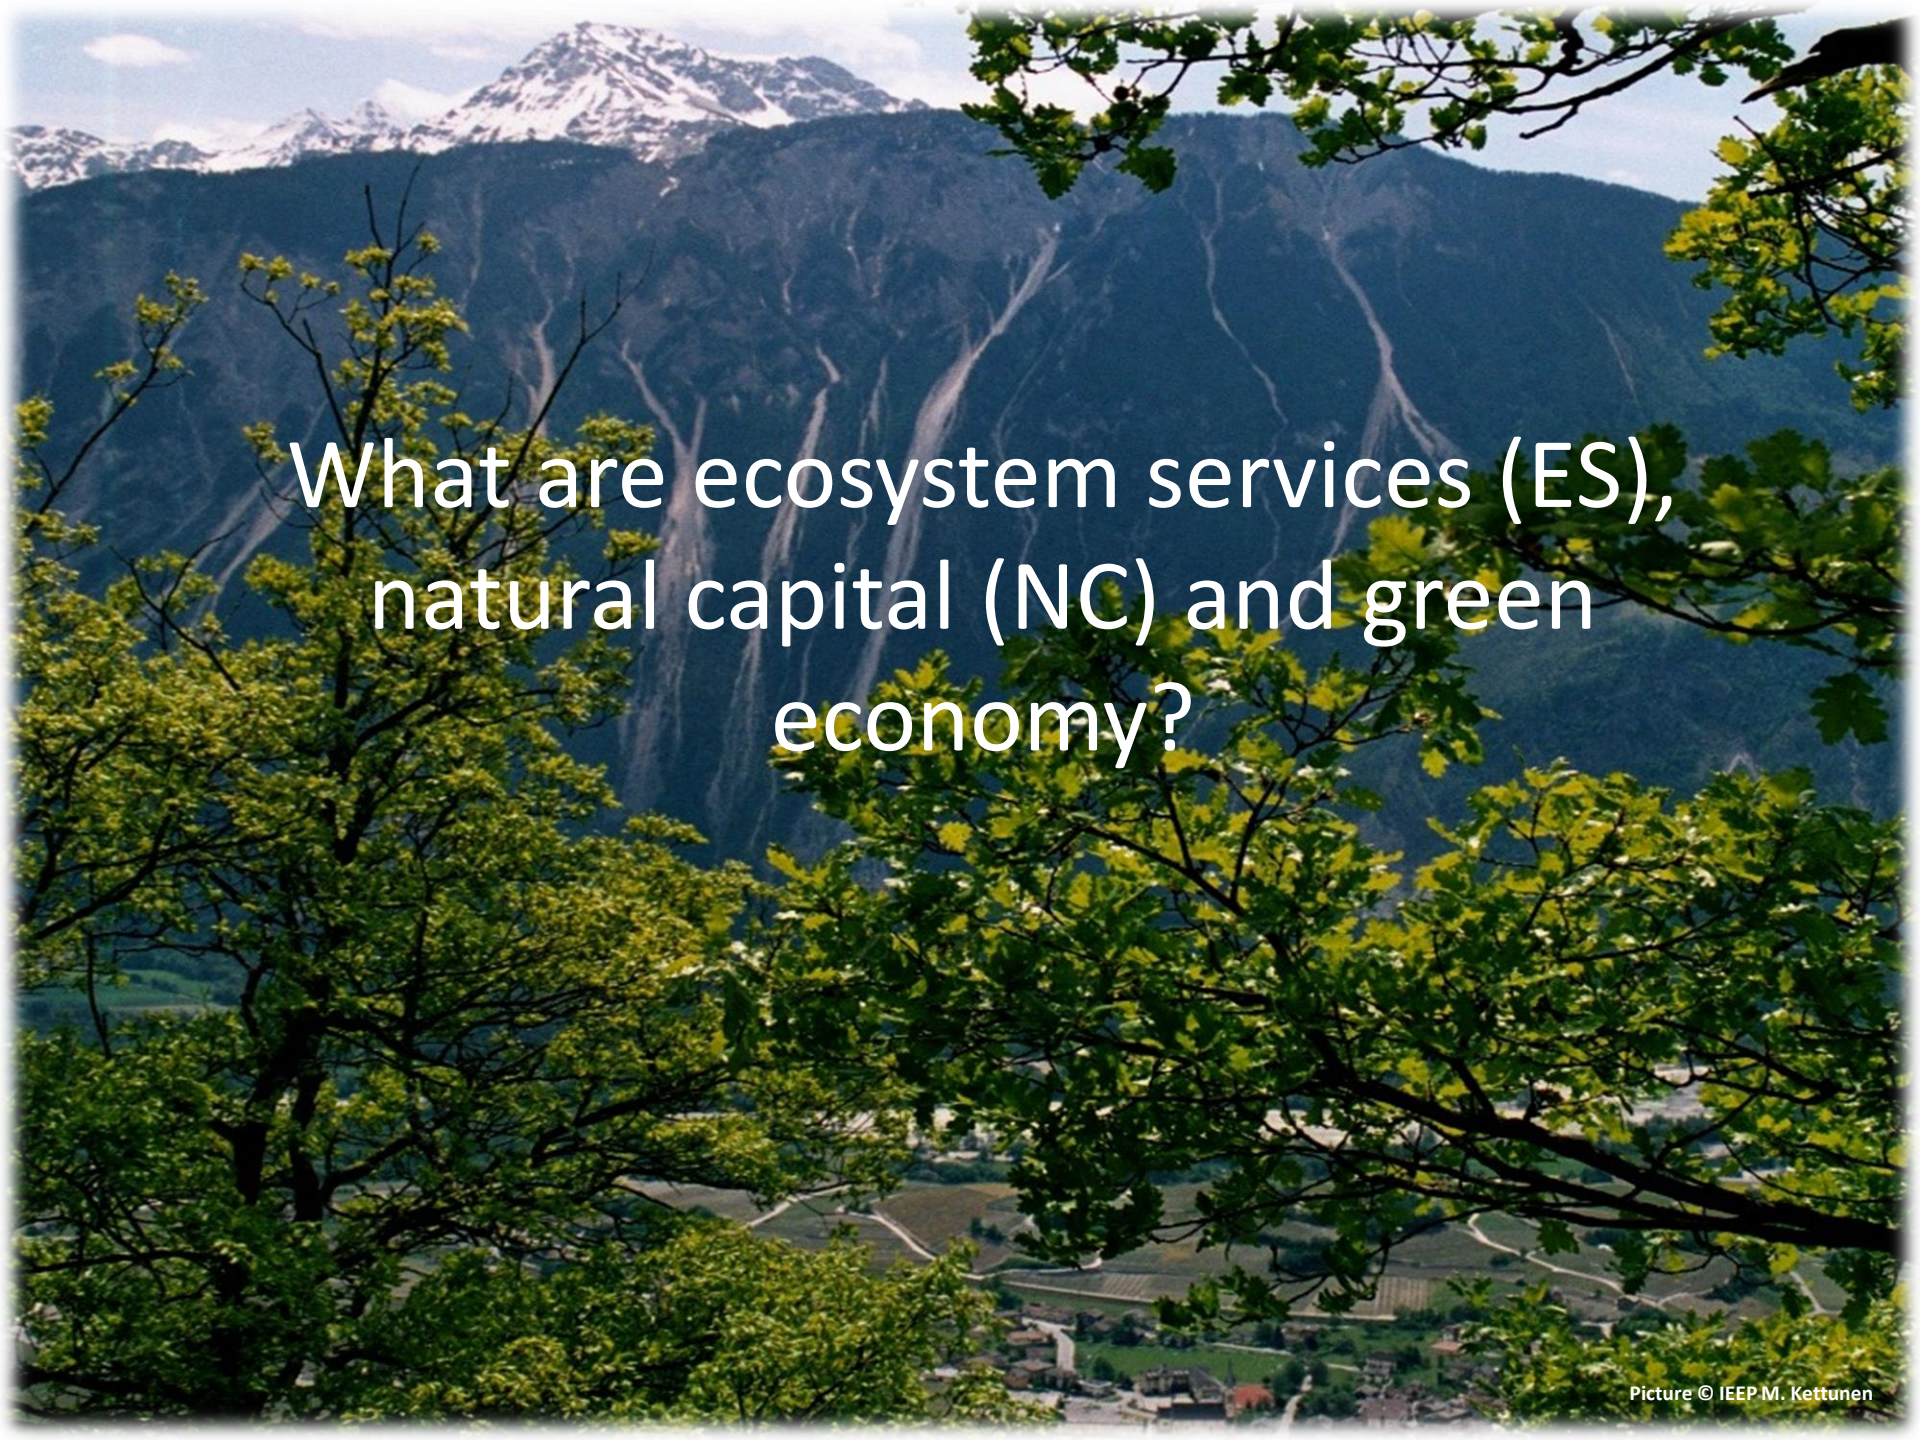

A decorative header banner featuring a close-up of vibrant green leaves with prominent veins, set against a dark green background. The leaves are slightly out of focus, creating a sense of depth.

- Ecosystem services (ES), natural capital (NC) and green economy
- Why are ecosystem services and natural capital integral to green economy ?
- Towards a truly green economy - integrating ES and NC to policies and decision-making

What are ecosystem services (ES),  
natural capital (NC) and green  
economy?

# Ecosystem services

## **Provisioning Services** (i.e. ecosystems' ability to provide resources)

E.g. Food provisioning - Water provisioning - Raw material - Medicinal resources / biochemicals - Ornamental resources - Genetic resources

## **Regulating Services** (i.e. ecosystems' beneficial regulatory processes)

Climate regulation - Natural hazards regulation - Purification and detoxification of water, air and soil - Water / water flow - Erosion and soil fertility - Pollination - Pest and disease regulation

## **Cultural Services** (i.e. ecosystems' non-material benefits)

Opportunities for recreation and tourism - Aesthetic values - Inspiration for the arts - Information for education and research - Spiritual and religious experience - Cultural identity and heritage - Mental well-being and health

## **Supporting Services**

(i.e. services necessary for the production of all other ecosystem services)

Ecosystem process maintenance - Lifecycle maintenance - Biodiversity maintenance and protection

# Natural capital and green economy

Picture © IEEP Web

## What is natural capital?

*'Natural capital' is an 'economic metaphor for the limited stocks of physical and biological resources found on earth' (MA, 2005).*

## What is green economy?

UNEP defines a green economy as *“one that results in improved human well-being and social equity, while significantly reducing environmental risks and ecological scarcities.*

*In its simplest expression, a green economy can be thought of as one which is **low carbon, resource efficient and socially inclusive**”*

Protection and restoration of natural capital a key component.

A scenic landscape photograph featuring a mountain range in the background with several peaks covered in snow. The mountains are partially obscured by dense green foliage in the foreground, which frames the scene. The foliage consists of various types of trees and bushes with vibrant green leaves. The sky is visible at the top, showing a mix of blue and white clouds. The overall atmosphere is serene and natural.

Why are ES and NC integral to  
a green economy?

# Problem: the invisible value of ES and NC

**Provisioning Services**  
(i.e. ecosystems' ability to provide resources)

**Only services with market value recognised**

- Ornamental resources - Genetic resources

**SALE**

**Regulating Services**  
(i.e. ecosystems' beneficial regulatory)

**Not integrated / no price signals**

regulation - Purification - Soil -  
detoxification - Water / water -  
soil fertility - diseases and

# Example: recreation and tourism

- **Denmark:** ~70 % of Danes visit green areas several times a week
- **Norway:** hiking in nature is practised more than twice a month by almost half of the population (i.e. around 2.4 million people)
- **Finland:** 1 EUR financial support for the management of national parks provides 10 EUR return for the region

**Name of national park in Finland**

*Some examples of total 37*

**Local, accumulative economic impacts of visits (EUR mil / year)**

**Person-years of employment**

# Example: pollination

- **Finland:** the value of honeybee pollination service of selected crops would be around 18 million EUR and of wild berries (bilberry and lingonberry) 3.9 million EUR
- **Finland :** estimated value of pollination (by honeybees) in home gardens was 39 million EUR in Finland
- **Denmark:** the value of the general insect pollination service was calculated to be worth ~56 to ~93million EUR) a year
- **Sweden:** the value of honeybee pollination service was calculated to be ~21.5 - ~37 million EUR

A scenic landscape photograph showing a mountain valley. In the background, there are dark, forested mountains with prominent, snow-capped peaks under a blue sky with light clouds. The middle ground shows a valley with green fields and a small village. The foreground is filled with the branches and leaves of green trees, which are slightly out of focus, framing the view. The text "Towards a truly green economy: integrating ES and NC to policies and decision-making" is overlaid in white, sans-serif font in the center of the image.

Towards a truly green economy:  
integrating ES and NC to  
policies and decision-making

# A truly green economy

Building green economy on ecosystem services:

1. Understanding the value of ecosystem services & natural capital
2. Integrating the value of nature & natural capital into the foundations of decision-making
3. Providing the right economic signals – removing harmful subsidies and creating incentives to sustainable use of natural capital
4. Investing green (eg. green infrastructure) & creating green jobs

## Ecosystem accounts (EA) & System of Integrated Environmental and Economic Accounting (SEEA)

The screenshot displays the UNDP website's HDI data interface. On the left, a table lists countries with columns for Country, Rank, and HDI. The 'Rank' column is sorted in descending order, with South Korea at the top (Rank 1, HDI 0.900) and Bhutan at the bottom (Rank 159, HDI 0.470). The 'Country' column includes a checkbox for each entry. The 'HDI' column shows the HDI value for each country. Below the table, a line graph titled 'HDI Trends' shows the HDI values for the selected countries from 1970 to 2010. The graph shows a general upward trend for most countries, with South Korea and Japan showing the highest HDI values and Bhutan showing the lowest. The graph also includes a legend for the countries and a 'Download' button.

Country	Rank	HDI
South Korea	1	0.900
Japan	2	0.870
Finland	3	0.870
Denmark	4	0.870
Sweden	5	0.870
Norway	6	0.870

## A bundle of greener macroeconomic & societal indicators

# Example: from ES indicators to natural capital accounting in Finland

## Services by category

- ☐ Provisioning services
- ☒ [Regulating services](#)
- ☐ Cultural services

Home > Ecosystem services > Regulating services

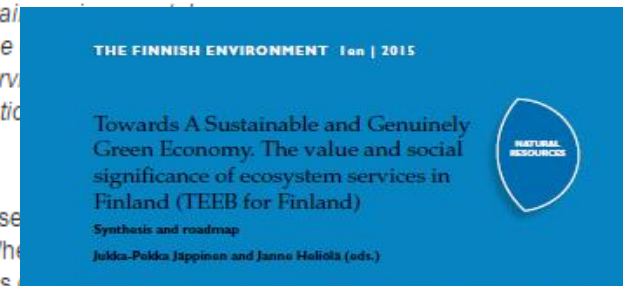

## Regulating services

Regulating services consist of ecosystem processes that maintain the balance of the environment. Some of the most important of these are the services that regulate the climate, water, and noise. Some regulating services are visible, such as the regulation of noise and pollution, while others are not visible, such as the regulation of the climate and water.

- ☒ Water retention
- ☒ Water filtration
- ☒ Climate regulation
- ☒ Nitrogen fixation
- ☒ Erosion control
- ☒ Soil quality
- ☒ Nutrient retention
- ☒ Mediation of waste and toxins
- ☒ Nursery habitats
- ☒ Pollination
- ☒ Air quality
- ☒ Noise reduction

Regulating services are often subject to what has been famously described as the Tragedy of the Commons, where individuals depleting a shared resource out of rational self-interest. The market mechanism to regulate its use.

The most important regulating services are mostly the same in Finland and other countries. Possibly the most important is the cycling of carbon between the atmosphere, land, and water.

MINISTRY OF THE ENVIRONMENT

# Example: recommendations for natural capital accounting in Finland

**Forest accounts:** complement info on timber with info on carbon, quality of forest ecosystems (e.g. soil quality), wild berries, tourism and food resources for reindeer herding (lichen)

**Water accounts:** combine existing info on water resources and quality, add info on water retention and infiltration capacity → dedicated water accounts

**Fisheries accounts:** complement existing information on fisheries catch with information on status of fisheries resources, include information both on commercial and recreational fisheries capacity → dedicated fisheries accounts

**Tourism accounts:** existing Tourism Satellite Accounts (TSA) could be expanded to include a dedicated element focusing on nature-based tourism

# Providing right signals: mainstreaming ES / NC into sectoral policies

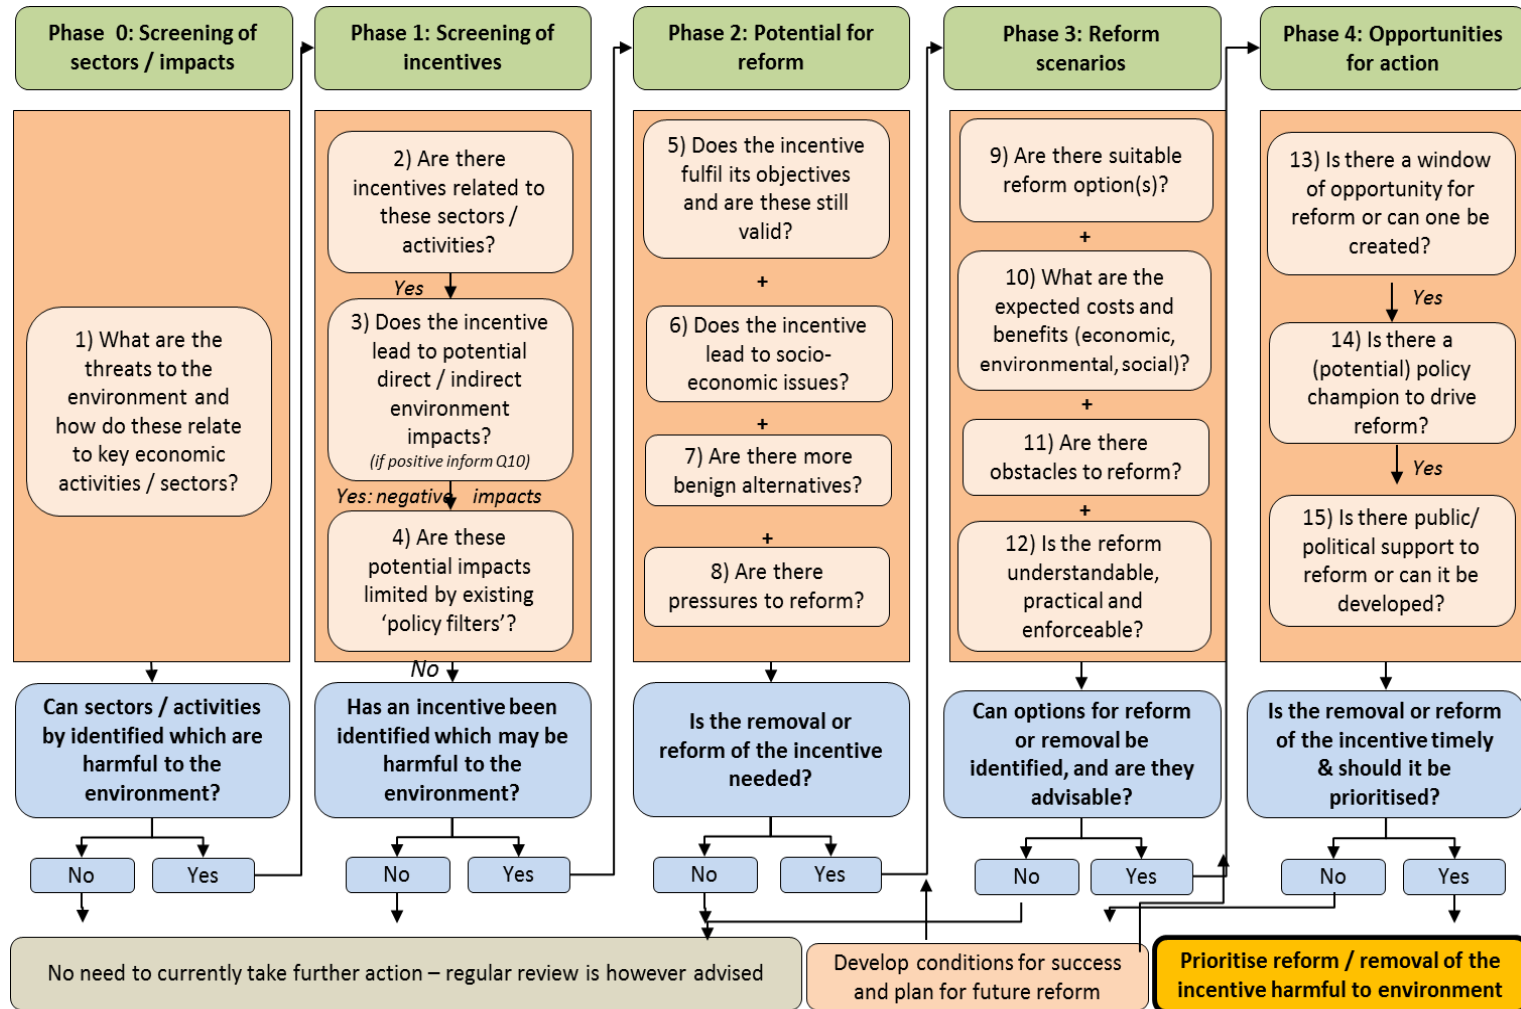

Policy sector	Conceptual integration		Operational integration	
Air	[Name relevant policy]		[Name relevant policy instruments]	
Soil				
Water				
Agriculture & rural development				
Forestry		Level of integration	Conceptual integration	Operational integration
Marine & coastal (incl. fisheries)		Comprehensive and explicit	All ecosystem services & recognition of contribution to human wellbeing	Dedicated instruments enabling comprehensive integration.
Regional development / Cohesion Policy				
Climate Mitigation & Adaptation		Explicit but not comprehensive	Some ecosystem services & recognition of contribution to human wellbeing	Some instruments that proactively address / build on ESS/NC within the policy area.
Bio-energy				
Transport & grey infrastructure		Implicit and incomprehensive	Generally focus on preventing negative impacts of a policy sector to ecosystem services and natural capital	Some aspects - mainly avoid negative impacts on (some) ecosystem services - integrated into sectoral instruments.
		No specific integration	No recognition (direct / indirect) of ecosystem services and natural capital	No instruments exist that would in any way address ESS/NC.

© Currently being developed  
by Kettunen & ten Brink under  
EU FP7 OPERAs project

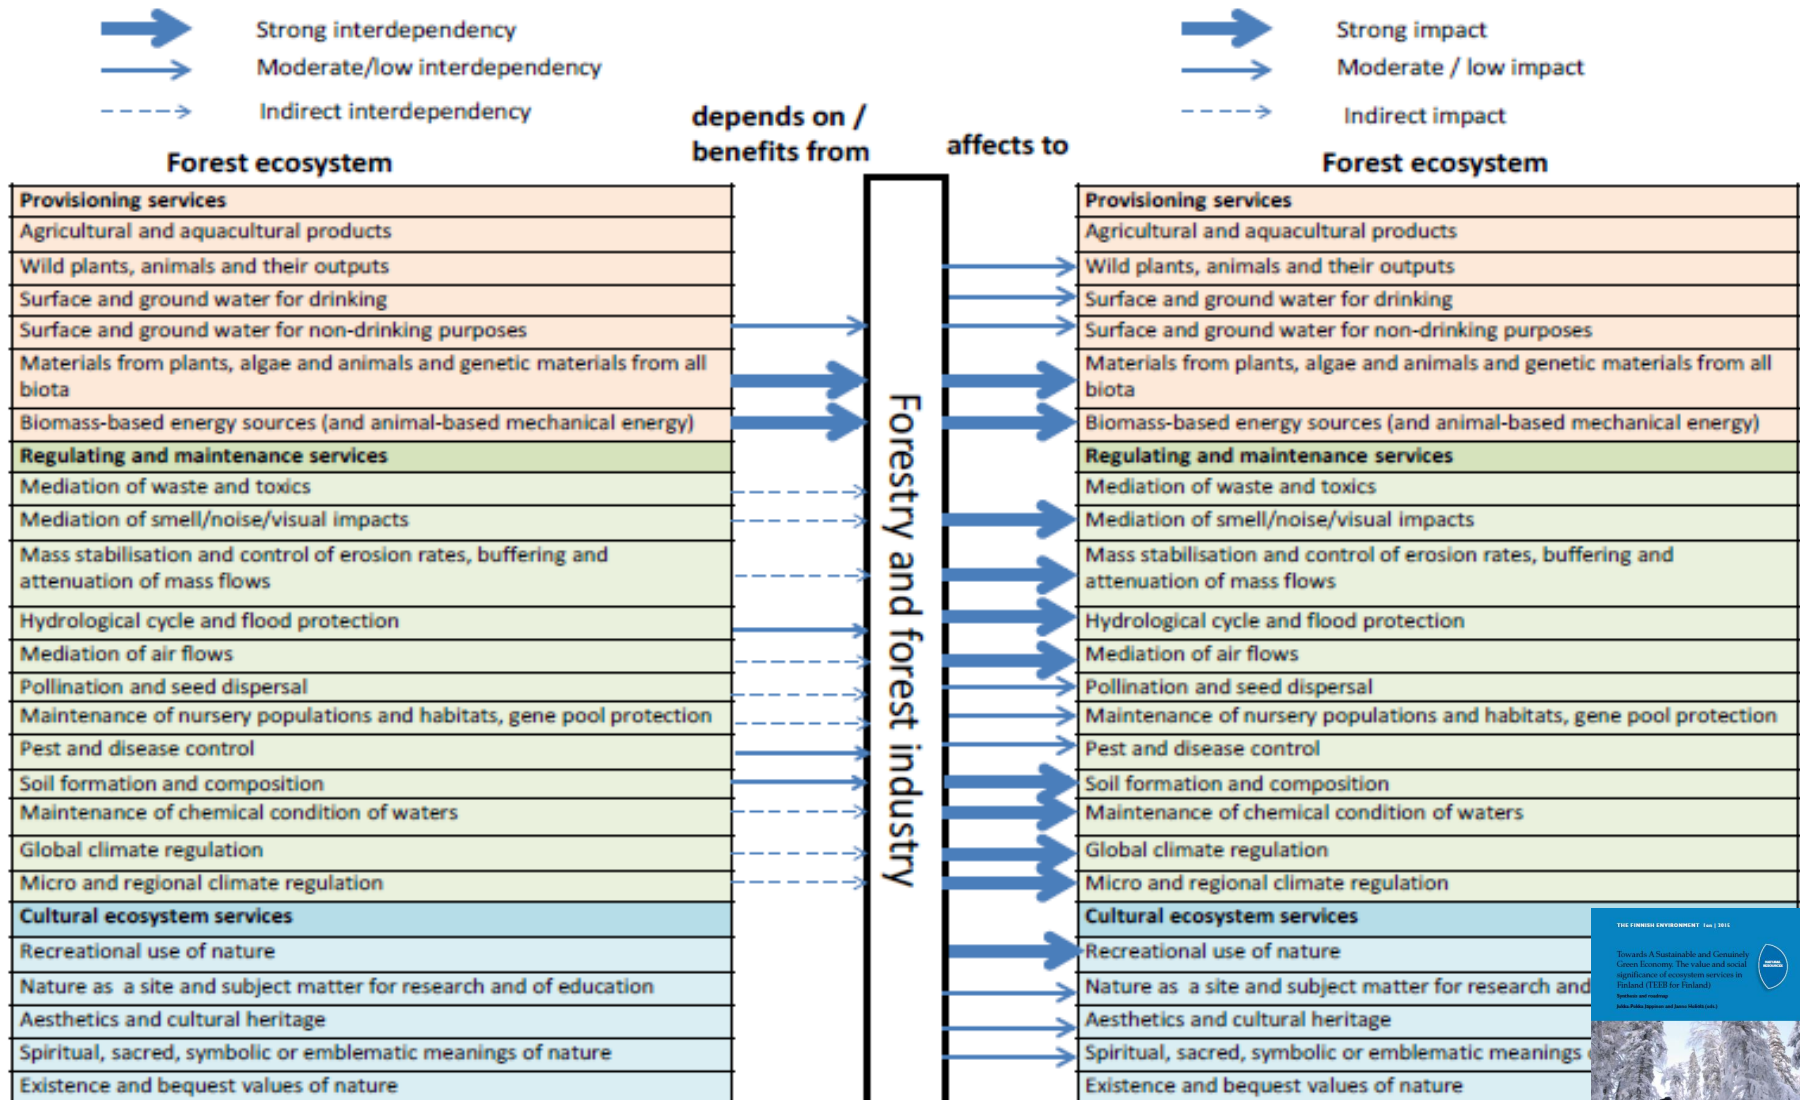

# Providing right signals: removing subsidies harmful for ES / NC

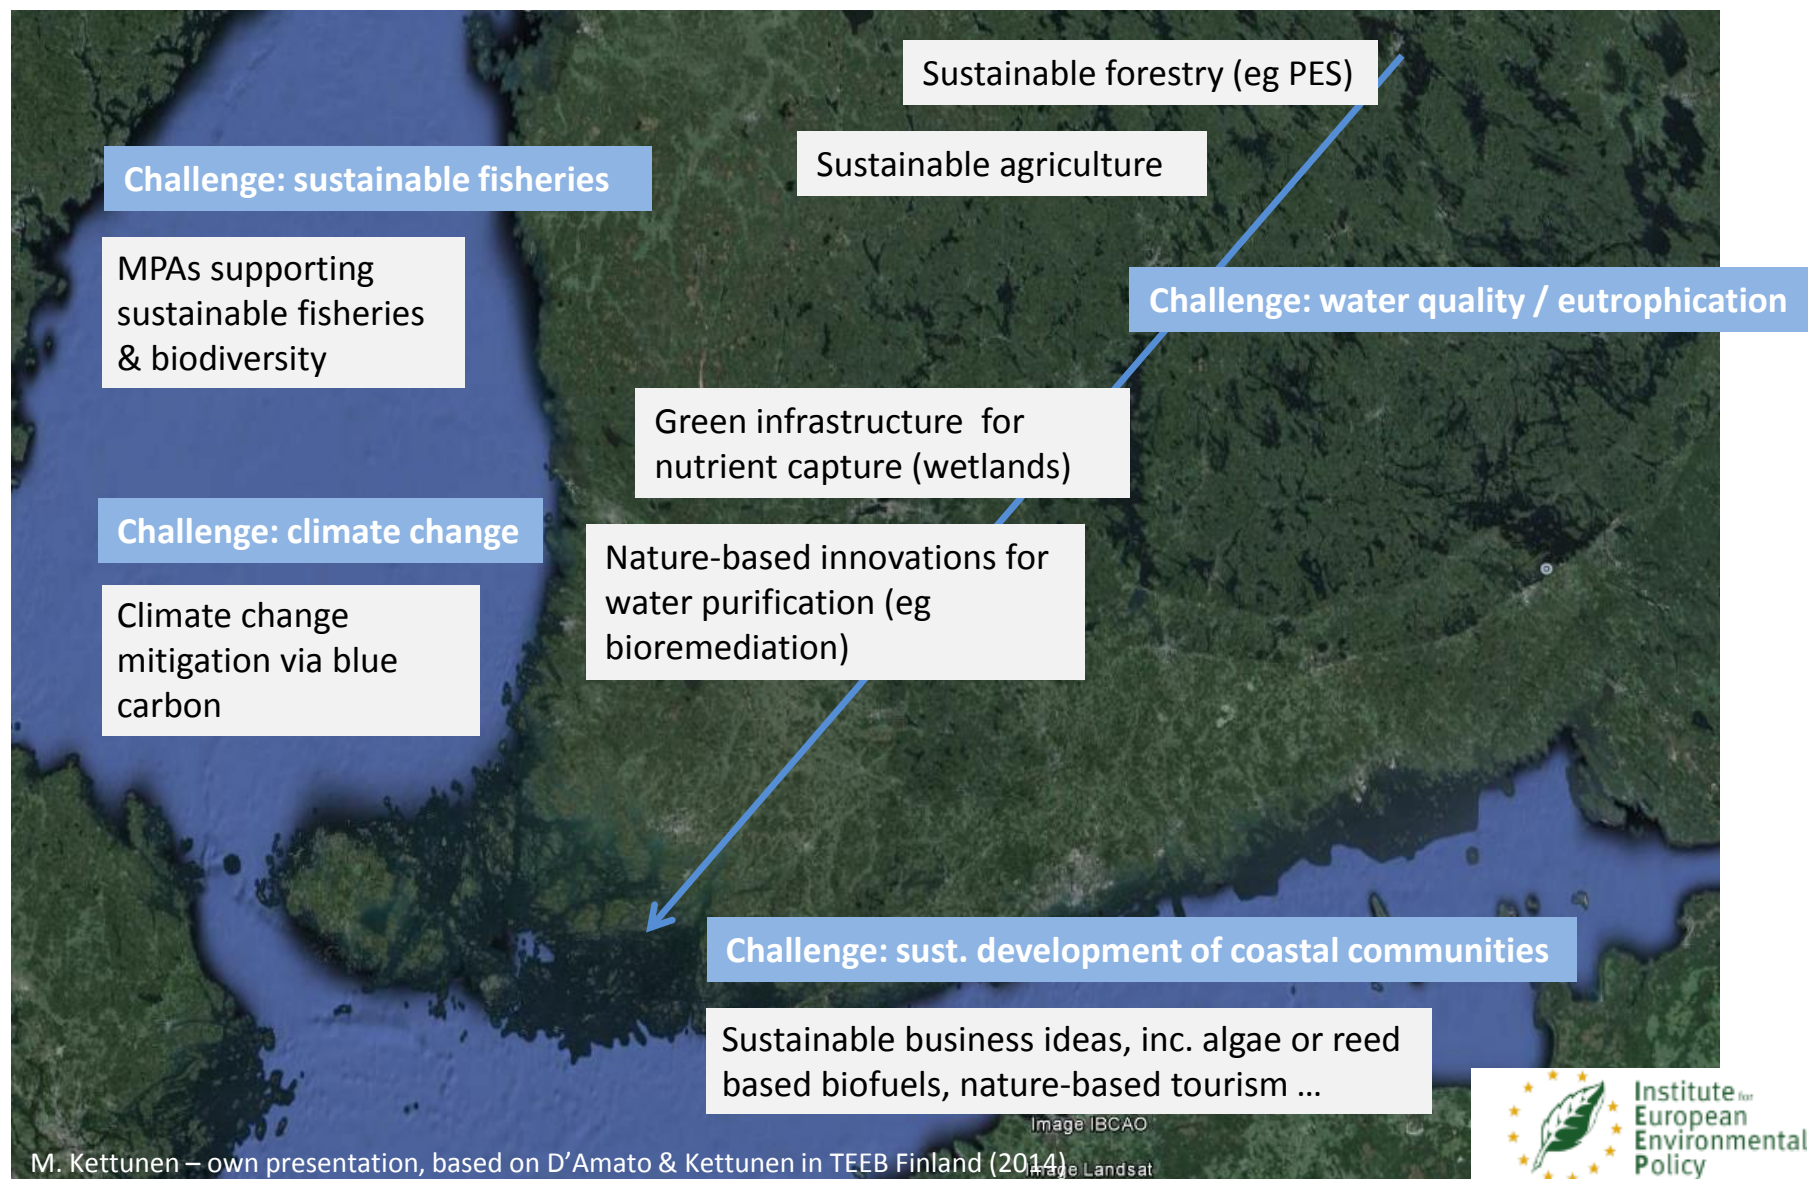

# Providing right signals:

assessing and addressing interlinkages between ES & economic sectors

# → Investing in nature-based solutions for sustainable development

# A truly green economy

Building green economy on ecosystem services:

1. **Understanding the value** of nature & natural capital – even where the values are not market based.
2. **Integrating the value** of nature & natural capital into the foundations of decision-making (strategies, plans & regulations, accounting systems, indicators, impacts assessments, tools for landuse planning ...).
3. **Providing the right signals** – removing harmful subsidies and creating incentives to sustainable use of natural capital within policies
4. → **Investing green** (eg. green infrastructure) & creating green jobs

**Can be established at different levels: national – regional – local**
